# 1. Introduction

This document presents low-fidelity wireframes for the 12 highest-priority screens of the Deutsche Bank India UPI Enablement Platform, covering one representative screen from each of the platform's 10 modules. These wireframes are intentionally low-fidelity (greyscale, placeholder-based) — they define layout, information hierarchy, and interaction points, not final visual design. They are intended to be imported into Figma (via image trace or manual rebuild) as the starting point for high-fidelity UI design, which remains the responsibility of the design team.

The full 23-screen inventory is defined in Section 15 of the Business Requirements Document (BRD); the 12 screens detailed here were selected as the most structurally representative and highest-traffic screens. Remaining screens (PIN Reset/Change, Manage Linked Accounts, Dispute Tracking, Notification Centre/Preferences, Collect Approve/Reject, Scan & Pay camera view, Transaction Detail) follow the same layout patterns, components, and interaction conventions established here.

## 1.1 Wireframe Conventions

| Element                           | Meaning                                                      |
|-----------------------------------|--------------------------------------------------------------|
| Rounded rectangle (filled navy)   | Primary action button                                        |
| Rounded rectangle (outline only)  | Secondary / alternate action button                          |
| Rectangle with label above        | Text input field                                             |
| Circle + two lines of text        | List item (e.g., transaction, payee, notification)           |
| Dashed box with crossed diagonals | Placeholder for a generated image (QR code, chart, or photo) |
| Tab bar (segmented control)       | Mutually exclusive selection (e.g., payment method tabs)     |
| Bottom row of circles + labels    | Primary bottom navigation bar                                |

## 2. Home & Registration

UPI Landing / Home

Registration — Mobile Verification

### 2.1 UPI Landing / Home

Entry point to all UPI functions from the mobile app home screen. Primary actions (Send Money, Scan & Pay, Request Money, My QR Code) are presented as equally weighted large tap targets, with recent transactions surfaced below for quick reference. Related: FR-REG-01, FR-HIS-01.

### 2.2 Registration — Mobile Verification

First step of UPI registration. The registered mobile number is auto-fetched and masked (read-only); the customer only interacts with the OTP field. A visible countdown and resend option manage the 300-second OTP expiry window. Related: FR-REG-02, FR-REG-03.

### 3. Consent & Registration Success

Registration — Consent

Registration — Success

#### 3.1 Registration — Consent

Presents the current consent version text in a scrollable placeholder area, with symmetric Accept/Decline actions — deliberately not defaulting visual weight toward Accept, to avoid dark-pattern framing of a compliance-critical consent decision. Related: FR-REG-05, FR-REG-06.

#### 3.2 Registration — Success

Confirms successful registration with the assigned VPA and offers an immediate path into PIN setup, with a clearly available (not hidden) option to defer. Related: FR-REG-09, FR-REG-11.

## 4. PIN Setup & Send Money

**Set UPI PIN**

- ☐ Zomato  
zomato.pay@icici
- ☐ Priya Sharma  
priya.s@okhdfc

Send Money — Select Payee

### 4.1 Set UPI PIN

Groups identity validation fields (debit card + OTP) visually separate from the new-PIN fields via a divider, reinforcing that these are two distinct steps even on a single scroll screen. Related: FR-PIN-01 to FR-PIN-04.

### 4.2 Send Money — Select Payee

A segmented tab control switches between the four payee-resolution methods (Mobile, UPI ID, QR, Bank+IFSC) without navigating away from the screen; recent/favourite payees are surfaced below for faster repeat payments. Related: FR-TXN-01 to FR-TXN-05.

## 5. Send Money — Amount, PIN & Status

Share Receipt

Done

Send Money — Status (Success)

### 5.1 Send Money — Enter Amount & Authorise

Recipient identity is confirmed at the top before amount entry, reducing misdirected-payment risk. The PIN field is visually separated below a divider as the final, distinct authorisation step, and the primary button dynamically reflects the entered amount. Related: FR-TXN-06, FR-TXN-07.

### 5.2 Send Money — Status (Success)

Confirms outcome immediately with the NPCI RRN and internal transaction ID both visible for the customer's own record-keeping or future dispute reference, alongside share/receipt actions. Related: FR-TXN-11, FR-HIS-04.

## 6. Collect Request & QR Code

Request Money — Create

My QR Code

### 6.1 Request Money — Create

A single-screen form for creating a collect request, with the 24-hour expiry policy stated explicitly so the customer understands the request is time-bound before sending it. Related: FR-COL-01, BR-COL-01.

### 6.2 My QR Code

A tab control switches between Static (flexible amount) and Dynamic (fixed amount) QR types; the linked default account is shown alongside the code so the customer knows which account will be credited. Related: FR-QR-01, FR-QR-02.

## 7. Transaction History & Dispute

### 7.1 Transaction History

Transactions are grouped by day for scanability, with Filters and Export actions available at the top without requiring a separate screen. Failed transactions are visually distinguishable in the status area (not shown in this greyscale mockup, but specified for the high-fidelity design). Related: FR-HIS-01, FR-HIS-02.

### 7.2 Raise Dispute

Pre-populates the transaction context so the customer doesn't need to re-identify it, requires category selection before free-text description to support downstream routing, and offers optional evidence attachment. Related: FR-DIS-01, FR-DIS-02.
